

AHAAN SONI

Backend Engineer | Distributed Systems | Scalable & Compliance-Grade Backend

Bengaluru, KA • +91-8946973941 • ahaansoni@gmail.com • linkedin.com/in/ahaansoni • ahaansoni.github.io

SUMMARY

Backend Engineer with 5+ years building large-scale distributed systems across banking, payments, IoT/telematics, insurtech, and edtech. Deep experience in event-driven architecture (Kafka, RabbitMQ, MQTT), microservices, compliance-grade backend services, and operational excellence (CI/CD, observability, on-call response). Owns delivery end-to-end from system design through production rollout in mission-critical environments. Prior full-stack experience across React, Redux, Tailwind, and serverless architectures.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript

Backend: Node.js, NestJS, Express.js, routing-controllers, TypeDI, REST APIs, WebSockets, Serverless Framework, AWS Lambda

Distributed Systems & Architecture: Apache Kafka, RabbitMQ, MQTT, Protobuf, Microservices, SAGA, Circuit Breaker, Event-Driven Design, STP / Config-driven Flows, Compliance & Audit Pipelines, Multi-tenant Services

Data: PostgreSQL, MongoDB, DynamoDB, Redis, Pinecone, TimeScale, Sequelize, TypeORM

Cloud & DevOps: AWS (EC2, Lambda, API Gateway, S3, CloudWatch, IAM, Elastic Beanstalk, ELB, VPC), Docker, Jenkins, CodePipeline, CI/CD

Frontend: React, Redux, Tailwind CSS, Chakra UI, HTML, CSS

Observability & Quality: Kibana, Grafana, Prometheus, AppDynamics, Jest, Swagger/OpenAPI, ESLint, Husky; AI-assisted dev with Claude Code, Cursor & GitHub Copilot

PROFESSIONAL EXPERIENCE

Associate Staff Engineer | Nagarro

Jun 2025 – Present

Client: Banking — Backend platform for IVR & customer-service workflows on config-driven STP across multiple core banking systems
Bengaluru, India

- **Multi-phase config-driven service journeys:** Owned end-to-end delivery of a new customer-facing service-request journey on a three-phase config-driven workflow engine (pre-validation, pre-execution, post-execution) designed the configuration schema, integrated with the loyalty backend, and shipped with full audit traceability.
- **Schema-extension at scale:** Extended an existing customer-data update journey to support multiple addresses and varied contact schemas as a fully config-driven flow authored 1,900+ lines of DB configuration and shipped in ~2 weeks with zero application-code changes for future field additions.
- **Distributed cache invalidation:** Built a Kafka-driven cache-invalidation flow for user-permission updates across multiple service pods endpoint clears the emitter's local Redis and publishes a permission-reset event; other pods consume and invalidate their caches, with consume-acknowledgments logged for audit traceability.
- **LLM-driven journey recommendations:** Integrated an internal LLM for journey recommendations engineered the prompt-payload construction combining real-time customer-journey footprints with workflow metadata; returned top-3 matches that auto-fill the agent UI and skip manual lookup, reducing handle time.
- **Live-site & incident response:** Provided UAT and war-room support for a major service-journey rollout diagnosed live issues across orchestration, validation, and core-system integration layers; unblocked failing cases in production via targeted config-driven fixes (zero code change).
- **Test automation:** Authored end-to-end Playwright + Cucumber test scenarios for backend changes; attached generated coverage reports to JIRA tickets for traceability and audit evidence.

Backend Developer | Intangles

Nov 2024 – May 2025

Camera-based Driver Intelligence & Telematics Platform

Pune, India

- **Camera-based driver attendance:** Built the attendance pipeline behind driver payroll cameras stream face-detection telemetry into TimescaleDB every ~2s across 3,000+ vehicles and 10,000+ drivers. Wrote the session logic in Node.js: persist to MongoDB only on state change (driver seated / absent / face change) instead of every tick, and roll sessions at midnight for clean day-wise reporting. Accuracy directly drove payroll, so the validation logic was the hard part.
- **Configuration-over-the-air (COTA):** Built a COTA backend (Node.js + MongoDB) to remotely manage ~190 config fields across 10,000+ SIM-connected cameras eliminating physical visits. On boot, cameras publish their config as Protobuf (chosen for limited cellular bandwidth) to a RabbitMQ queue; the service deserializes, diffs against the DB config

(compared in Protobuf for speed), and pushes only changed fields back with DB values winning. Authored REST CRUD APIs for the backend team to manage per-account configs.

- **ADAS / DMS alert processing:** Extended a Python alert-processing pipeline handling ~80 messages/sec from TimescaleDB, generating 12 distinct safety alerts (e.g. tailgating). Added new alert types; on trigger, pulled incident video clips from S3 and handed off to the Node service to persist and notify the driver. Used per-device ordering with bounded concurrency to guarantee in-order processing without serializing the whole pipeline.

Software Engineer L1 → L2 → Senior SDE L1 | Gemini Solutions

Mar 2022 – Nov 2024

*Promoted twice over 2.7 years across enterprise client work in banking, insurance, real estate, and consumer platforms
Gurgaon, India*

- **TATA Banca — Pan-India Insurance Platform:** Led backend development on a microservices + serverless platform (Node.js, AWS Lambda, MongoDB) managing ₹36,000+ Cr in policies across 10+ partner banks. Integrated diverse banking partner systems with varying security and API standards; implemented AES encryption and token-based auth for secure data transfer; deployed via AWS CodePipeline with each API as an independent Lambda. Engagement +30%, conversion +25%.
- **Emaar Group — B2B Mall Services Dashboard:** Built an interactive dashboard for managing services, requests, and 1,000+ shops across Emaar's global mall portfolio.
- **Project Untold (Cinema Investment Platform):** Led architecture, API design, and core transaction flows on the MERN stack for a platform enabling users to invest directly in films and earn revenue shares.
- **Athletic Estate (Merchandise Platform):** Built a sales platform with React, Node.js, PostgreSQL, and Tailwind, driving a 25% sales lift across school-to-international sporting leagues.

Software Engineer | Schoollog

Oct 2021 – Feb 2022

School ERP / CRM platform

Jaipur, India

- Solely responsible for backend API development on Node.js, NestJS, and MongoDB across CRM and ERP products. Delivered features end-to-end including new endpoints driven by business requirements; bridged client engagement and technical implementation on the COCO project.

Process Associate | Genpact

Feb 2019 – Sep 2021

Pre-engineering — international client operations

India

- Managed international client accounts focused on process accuracy, communication, and timely issue resolution; led a team end-to-end, owning targets and stakeholder communication between upper management and the team.

TRAINING

MERN Stack Development Internship • Edureka

May 2021 – Oct 2021

PERSONAL PROJECT

SIKKA — Crypto Payment Platform: Multi-service crypto payments platform built from scratch as a deep dive into payments infrastructure. Two Node.js/TypeScript microservices on Neon PostgreSQL wallets, transactions, payment links, webhook delivery, JWT-based inter-service auth, immutable audit logs enforced via PostgreSQL triggers (in active development).

EDUCATION

Bachelor of Computer Applications (BCA) • Lal Bahadur Shastri P.G. College, Jaipur

Jul 2014 – Aug 2017
